

CS 465 Module Seven Assignment Guidelines and Rubric

Overview

You now have a working full stack project that serves both the public customer-facing and admin sides of the application. Now, it's time to add security functionality for secure login authentication. To complete the project, you will learn about and apply security features to the single-page application (SPA), such as producing secure web tokens for authentication.

Prompt

Follow the instructions in the Module Seven Full Stack Guide linked in the Supporting Materials section.

Specifically, you must address the following rubric criteria:

- **Develop a security protocol** by adding a single layer of security to the SPA admin side, including an HTML login form for the admin site and logic to secure the administrative endpoint methods.
- **Test the security protocol** by testing the authentication with mock data and verify the new user-class API endpoints using Postman.
- **Incorporate the security protocol** by refactoring the front-end and back-end websites.
- **Test the front-end website** by logging in to ensure CRUD features are enabled.

What to Submit

Submit the updated travlr.zip zipped file folder.

Note: You will also push your local Git repository module7 branch to your GitHub repository. This procedure will become second nature to you as you move through the course modules. In the end, you will have a full stack web application with branches that represent key stages of building a full stack application leading up to the full stack project completion.

Supporting Materials

The following resource supports your work on this assignment:

Resource: [Module Seven Full Stack Guide](#)

Follow the instructions in this guide to complete the assignment and support your development of the full stack web application.

Module Seven Assignment Rubric

Criteria	Meets Expectations	Partially Meets Expectations	Does Not Meet Expectations	Value
Develop Security Protocol	Develops a security protocol for the SPA to add login authentication with secure admin endpoints (100%)	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include ensuring security is fully implemented (70%)	Does not attempt criterion (0%)	40
Test Security Protocol	Tests the code to ensure full stack web application is secure and functioning (100%)	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include thoroughly testing all combinations of user interaction (70%)	Does not attempt criterion (0%)	10
Incorporate Security Protocol	Refactors the front-end and back-end websites to incorporate the security protocol (100%)	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include secure elements appearing without logging in or API endpoints being able to be invoked without secure tokens (70%)	Does not attempt criterion (0%)	40
Test Front-end	Tests the front-end website by logging in to ensure CRUD features are now enabled (100%)	N/A	Does not attempt criterion (0%)	10
Total:				100%
