

CS 465 Module Two Assignment Guidelines and Rubric

Overview

This assignment is a prerequisite for Milestone One. In this assignment, you will use your new JavaScript skills to refactor the website code based on the client wireframe. You will organize the default code and folder layout into a structure that reflects a Model View Controller (MVC) approach to the software design.

Templating is a development technique used to build views dynamically. Handlebars (HBS) is a templating system offering extensibility and minimal logic that you will use in this assignment. You will learn how to apply HBS and MVC to produce efficient code that renders a website quickly.

Prompt

Follow the instructions in the Module Two Full Stack Guide linked in the Supporting Materials section. You will need to refactor the structure of the HTML Travlr website using the MVC pattern by adding a route and controller. The website must align with the customer requirements of the wireframe description provided in the [Project Guidelines and Rubric](#). You will continue this process for additional pages. Then you will begin implementing HBS templates. You will convert the static page to an HBS template page, then insert HBS directives to enable rendering of the views.

Once completed, submit a zipped file folder of your assignment work.

Specifically, you must address the following rubric criteria:

- Build the appropriate **MVC architecture** for templating and rendering data for the website.
- Develop and run **routes and controllers** for a public website aligning to your client's wireframe and software requirements.
- Use the **HBS templating engine** to place directives into templates and an MVC approach to display features in the web application.
- **Test** by using the HBS templating engine to render HTML within the website.

What to Submit

Submit a zipped file folder that contains a new **app_server** folder with routes and views folders as well as updates to app.js to register the new **traveler** controller class with the application.

Note: You will also push your local Git repository module2 branch to your GitHub repository. This procedure will become second nature to you as you move through the course modules. In the end, you will have a full stack web application with branches that represent key stages of building a full stack application leading up to full project completion.

Supporting Materials

The following resource supports your work on this assignment:

Resource: [Module Two Full Stack Guide](#)

Follow the instructions in this guide to complete the assignment and support your development of the full stack web application.

Module Two Assignment Rubric

Criteria	Meets Expectations (100%)	Partially Meets Expectations (70%)	Does Not Meet Expectations (0%)	Value
Architecture	Builds the appropriate MVC architecture for templating and rendering data for the website	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include establishing the correct processing flow from application to route to controller and visually rendering the dynamically generated content	Does not attempt criterion	50
Routes and Controllers	Develops and runs routes and controllers for a public website aligning to client requirements	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include registering the new route in the application, linking the new route to the traveler controller, or correctly setting up the sub-directories following the MVC pattern	Does not attempt criterion	20
Templating	Uses templating engine to place directives into templates and an MVC approach to display features in a web application	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include registering the path for Handlebars partials or converting the static HTML page to HBS template	Does not attempt criterion	20
Testing	Tests by using the templating engine to render HTML within the website	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include ensuring the hyperlinks work when using /travel as the URL	Does not attempt criterion	10
Total:				100%
