

CS 465 Module One Assignment Guidelines and Rubric

Overview

In this course, you will be building a full stack application, specifically called the MEAN stack. The acronym contains letters representing some of the critical software you will need to install before you begin development: MongoDB, Express, Angular, and Node.js. Before you begin this assignment, be sure to do the following tasks:

- Install Node.js and the Node package manager (NPM).
- Review the Project Guidelines and Rubric for this course.
- Review Travlr Getaways' software requirements, including the wireframe. These requirements are provided in the Project Guidelines and Rubric.
- Download and review the Travlr Getaways HTML mockup pages in the travlr.zip file folder in the Supporting Materials. Unzip the compressed file and double-click on **index.html** to open the webpage in the browser as shown below.

File View

This PC > Desktop > travlr

Name

- css
- images
- about.html
- beachresort.psd
- contact.html
- index.html
- meals.html
- news.html
- rooms.html
- travel.html

**Double-click
index.html**

ROOMS

In this assignment, you will produce a working shell of the customer-facing web application that is rendered in the browser. All of the steps are clearly outlined in your Full Stack Guide. You will refer to this guide throughout the course.

Prompt

Refer to the Module One Full Stack Guide linked in the Supporting Materials section below. Before you begin, clone your GitHub repository to a directory on your local computer, update the Git Ignore settings, and create a module1 branch to track the work done here.

Specifically, you must address the following rubric criteria:

- **Build a website using the Node.js server and the Express framework.** Create a full stack web application based on the client wireframe. Begin by setting up the website folder in the server framework application called Express. This framework can serve static HTML content and support using JavaScript to code the necessary logic and behaviors required to meet the client requirements.
- **Correctly place static HTML content into the appropriate Express framework folders.** Import the static HTML into the public folder and verify that the web server correctly sends the content to your web browser when you navigate to the proper URL.
- **Test the software installation to show that it renders the static HTML content in the browser.** Test the software application by using input and output to show that the application can display the HTML in Express.

What to Submit

Complete the steps to produce a working shell of the customer-facing web application that renders in the browser. Submit a screenshot showing that Express is working and a compressed ZIP file of the updated website folder.

Note: You will also push your local Git repository module1 branch to your GitHub repository. This procedure will become second nature to you as you move through the course modules. In the end, you will have a full stack web application with branches that represent key stages of building a full stack application leading up to full project completion.

Supporting Materials

The following resources support your work on this assignment:

Resource: [travlr](#)

This ZIP file contains a mockup of the Travlr Getaways site and other files needed for this course's assignments.

Resource: [Module One Full Stack Guide](#)

Follow the instructions in this guide to complete the assignment and support your development of the full stack web application.

Module One Assignment Rubric

Criteria	Meets Expectations (100%)	Partially Meets Expectations (70%)	Does Not Meet Expectations (0%)	Value
Functionality	Builds a website using the Node.js server and the Express framework	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include verifying commands, performing steps correctly, and ensuring all errors are resolved	Does not attempt criterion	33
Architecture	Correctly places static HTML content into the appropriate Express framework folders	Shows progress toward meeting expectations, but with errors or omissions	Does not attempt criterion	33
Testing	Tests software installation to show it renders the static HTML content in the browser	Shows progress toward meeting expectations, but with errors or omissions	Does not attempt criterion	34
Total:				100%
